

High Torque Clutches

Wichita High Torque Clutches provide the highest torque to size ratios of any Wichita Clutch. They provide smooth controlled starts and stops and are designed for minimum power loss due to low rotating inertia.

- Extremely fast response
- No lubrication
- High torque to size ratio
- Low rotating inertia

Selection Requirements

To properly select a High Torque Clutch and Low Inertia Brake, the following information must be determined.

1. Torque necessary to do the work (clutch)
2. Rotating inertia to be stopped and started
3. Heat generated by each stop/start
4. Torque necessary to stop inertia (brake)
5. Shaft size

Selection Example

Data

Rated Tonnage	As Required
Crankshaft Speed	30 RPM
(Continuous Run)	
Clutch-Brake Shaft RPM	204 RPM
Crankshaft Speed	30 RPM
Degrees of Crank to start	90°
Degrees of Crank to stop	90°
Connecting Rod Length = b	36 in.
Stroke	6 in.
1/2 of Press Stroke (throw) = a	3 in.
WR ² of Parts on Backshaft	78.2 lb.ft. ²
WR ² of Parts on Crankshaft	39,091 lb.ft. ²
Material Shear Stress	45,000 PSI
Blade Width	60 in.
Shaft Size	4 in.
Maximum Material to be Sheared	x
Air Pressure Available	100 PSI

Calculations

Torque @ Crank
 = (Material Shear Stress) (x) (Blade Width) (Torque Arm)

Torque arm = y = (x) (tan α)
 c = a + b - x
 = 3 + 36 - .25
 = 38.75 in.

Cos α

$$= \frac{b^2 + c^2 - a^2}{2 bc}$$

$$= \frac{(36)^2 + (38.75)^2 - (3)^2}{(2) (36) (38.75)}$$
 = .99948
 α = 1.8478°

Torque Arm = y = (c) (tan α)
 = (38.75) (tan 1.8478°)
 = (38.75) (.03226)
 = 1.25 in.

Torque @ Crank
 = (Material Shear Stress) (x) (Blade Width) (Torque Arm)
 = (45,000) (.25) (60) (1.25)
 = 843,750 lb.in.

Torque @ Clutch
 = (Torque @ Crank) ÷ $\frac{\text{Clutch RPM}}{\text{Crankshaft RPM}}$
 = 843,750 ÷ $\frac{204 \text{ RPM}}{30 \text{ RPM}}$
 = 124,081 lb.in.

High Torque Clutches

Clutch Selection

Per the application factors on page 23 a “Back Geared Press is ‘Group C’.”

$$\frac{\text{HP}}{100 \text{ RPM}} = \frac{\text{Torque}}{630} = \frac{124,081}{630} = 197$$

The preliminary clutch selection based on 124,081 lb.in. and 197 HP/100 RPM is an ATD-224 Low Inertia High Torque Clutch. (page 48)

A Low Inertia High Torque Clutch was chosen because of the continuous duty (non-cyclic) operation having a relatively low heat HP requirement.

ATD-224 Low Inertia High Torque Clutch = 280 HP/100 RPM

Rated Torque = 480,000 lb.in @ 100 PSI

Required clutch air pressure is:

$$\text{PSI} = \frac{\text{Clutch required torque} \times (100 \text{ PSI})}{\text{Catalog rated torque @ 100 PSI}}$$

Actual required clutch PSI

$$\begin{aligned} \text{PSI} &= \frac{124,081}{480,000} \times (100 \text{ PSI}) \\ &= 26 \text{ PSI minimum is required.} \end{aligned}$$

This application has 100 PSI available.

Contact velocity of rotating disc is:

$$\begin{aligned} V_c &= \frac{(\text{Diameter of Center Plate}) (\pi) (\text{RPM})}{12 \text{ in.ft.}} \\ &= \frac{24}{12} (\pi) (204) = 1,282 \frac{\text{ft.}}{\text{min.}} \end{aligned}$$

(Ductile iron is not required, see page 23).

Maximum bore for ATD-224 High Torque Low Inertia Clutch = 7 in.

Check clutch inflation time for 90° start angle (see page 52, PSI pressure curves)

Estimated time to start

$$\begin{aligned} &= \frac{\text{Start Angle}}{360^\circ} \frac{60}{\text{Crankshaft RPM}} \\ &= \frac{90^\circ}{360^\circ} \frac{60}{30} = 0.5 \text{ sec.} \end{aligned}$$

P_1 = Line pressure to clutch

P_2 = Required pressure to clutch

LN = Natural log

k = Inflation coefficient (ATD-224 H.T. @ 100 PSI)

= 2,600

u = For ATD-224 H.T. Clutch @ 100 PSI

= 2.5

Time to 26% of line pressure.

$$\begin{aligned} t &= \left[\frac{\text{LN} \left[\frac{P_1}{P_1 - P_2} \right]}{k} \right]^{\frac{1}{u}} \\ t &= \left[\frac{\text{LN} \left[\frac{100}{100 - 26} \right]}{2,600} \right]^{\frac{1}{2.5}} \\ &= 0.027 \text{ seconds} \end{aligned}$$

Clutch will be fully inflated at 90° of crankshaft rotation.

Clutch exhaust time @ 100 PSI = E = .078 (page 52).

Note:

This application example is for preliminary sizing only. Contact a Wichita Sales Engineer or the factory for final selection.

Low Inertia Brake Selection

To properly size a brake, the total rotating inertia reflected to the clutch and brake shaft must be known.

Alternate shaft WR²
referred to clutch shaft

$$= \frac{\text{Alternate shaft WR}^2}{\text{shaft WR}^2} \left[\frac{\text{Alternate shaft RPM}}{\text{clutch shaft RPM}} \right]^2$$

$$= 39,091 \left[\frac{30}{204} \right]^2$$

WR² referred to clutch-brake shaft = 845.4 lb.ft.²
@204 RPM

Total inertia Back shaft WR² = 78.2 lb.ft.²

Clutch hub & drive plate WR² from Specification Table = 101.0 lb.ft.²

Estimate brake WR² (assume same as clutch) = 101.0 lb.ft.²

Total WR² referred to clutch-brake = 1,125.66 lb.ft.²
(Estimated)

Estimated time to stop:

$$= \left[\frac{\text{Start Angle}}{360^\circ} \right] \left[\frac{60}{\text{Crankshaft RPM}} \right]$$

$$= \left[\frac{90^\circ}{360^\circ} \right] \left[\frac{60}{30} \right] = .5 \text{ sec.}$$

The deceleration torque is:

$$T = 12 \left[\frac{\text{WR}^2}{32.2} \right] \left[\frac{\text{Brake RPM}}{9.5(t)} \right]$$

$$= 12 \left[\frac{1125.6}{32.2} \right] \left[\frac{204}{9.5 (.5)} \right]$$

Deceleration Torque = 18,015 lb.in.

The HP / 100 RPM for this application is:

$$\frac{\text{HP}}{100 \text{ RPM}} = \frac{\text{Torque (lb.in.)}}{630} = \frac{18,015}{630} = 29 \text{ HP/100 RPM}$$

Consult the Specification Table on pages 36-37 to select a brake based on torque and HP/100 RPM. Under "Duty C", an ATD-214 brake has 32 HP/100 capacity and 55,250 lb.in. torque. The rotating inertia of an ATD-214 Low Inertia Brake is 11 lb.ft.². Therefore, the actual rotating inertia reflected to brake is 1035.6 lb.ft.².

The actual deceleration torque = $12 \left[\frac{1035.6}{32.2} \right] \left[\frac{204}{9.5} \right]$
= 16,575 lb. in.

Required air pressure is:

$$\text{Brake} = \frac{\text{Brake required torque x (100 PSI)}}{\text{Catalog rated torque @ 100 PSI}}$$

$$= \frac{16,575 \text{ lb. in.}}{55,250 \text{ lb. in.}} \times 100$$

$$= 30 \text{ PSI minimum}$$

This application has 100 PSI available.

The average heat HP each stop

$$= \frac{(\text{Brake Torque})}{63,000} \times \text{RPM} \times 1/2$$

$$= \frac{16,575}{63,000} \times 204 \times .5$$

$$= 26.8 \text{ HP}$$

Friction area necessary to absorb heat =

$$= \frac{\text{Heat HP}}{.7} = \frac{26.8}{.7} = 39 \text{ in.}^2$$

$$\frac{\text{heat HP}}{\text{Absorbtion rate for .5 sec.}} \text{ (see page 172)}$$

An ATD-214 Low Inertia Brake has 316 in.² of friction lining available to absorb heat generated by stopping. Maximum bore for an ATD-214 Low Inertia Brake is 4-1/8 inches.

Based on the given application data and the following calculations, an ATD-224 Low Inertia High Torque Clutch and ATD-214 Low Inertia Brake have been selected as having sufficient torque and heat dissipation capacity with minimum diameter and sufficient bore capacity.

Note:

These application examples are for preliminary sizing only. Contact a Wichita Sales Engineer or the factory for final selection.

B

Air system data

PSI pressure

Inflation

Clutch air pressure during inflation can be closely estimated by the following:

$$\text{Clutch pressure} = P_1 \left(1 - \frac{1}{e^{Ktu}} \right) \text{PSI (inflation)}$$

This equation is accurate from 5% up to 95% P_1 .

P_1 = Line pressure to clutch PSI

K and U = coefficients for specific clutch and air pressure from Specification Table on page 51.

e = Naperian base log

t_o = Time at initiation of signal for inflation sec.

t_d = Time delay of air system – sec.

Exhaust

Clutch air pressure during exhaust can be closely estimated by the following:

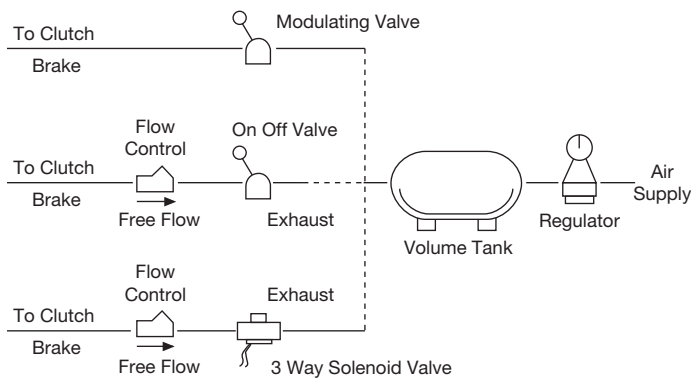

$$\text{Clutch pressure} = (P_1) (R) (E-t)^v \text{PSI (exhaust)}$$

R , E and V = coefficients for specific clutch and air pressure from Specification Table on page 51.

t_e = Time to exhaust = E from Specification Table on page 51.

t = Time variable – seconds. In the exhaust equation “ t ” cannot exceed the value of “ E ” sec.

Shown are some of the air systems used on Wichita clutches. These systems are acceptable for remote operation where clutch reaction time is not important. Faster clutch reaction time is accomplished as indicated in the diagram by locating the flow control valve, if required, and the solenoid valve as close as possible to the roto-coupling. Where clutches are located on long shafts, the use of quick release valves on the clutch will facilitate faster clutch response.

Overlap

A typical clutch-brake torque curve for a single backshaft press (cyclic application) would appear as shown below.

- t_{O_C} = time at which disengaged clutch receives signal
- t_{C_C} = time of clutch engagement
- t_{1_C} = time of clutch full inflation
- t_{O_B} = time at which disengaged brake receives signal
- t_{B_C} = time of brake engagement
- t_{1_B} = time of brake full exhaust
- t_2 = overlap time at which clutch and brake are both engaged
